

xFUSION

WEBDB SERVER

xFusion WebDB Server provides a better way for SAP customers to access and update data remotely. WebDB Server enables users to remotely connect to SAP and other business application data by leveraging industry-standard Web Services and other internet technologies to improve your department's operations.

xFusion WebDB Server can be quickly deployed on any desktop PC to make data access and management easier for SAP users.

U.S. Green Building Council chose xFusion WebDB Server to leverage the web in integrating data across multiple applications on different platforms. They now have the ability to securely exchange data outside the local network, and improve the visibility of important information.

Moving data in and out of SAP is simplified with xFusion WebDB Server as it works well with SAP data transfer utilities including LSMW, ADM, and e-CATT.

Key Benefits

- Mobile device access to business data
- Improve process repeatability
- Reduce custom programming
- Increase productivity without additional headcount
- Reduce or eliminate VPN, FTP, and email bottlenecks
- Streamline data processes including ordering, processing, inventory, and shipping processes
- Reduce technical maintenance overhead

Mobilize Information

- Move data from the SAP system to the web
- Improve the visibility of data by moving it to the end-user in a variety of formats
- Build and monitor Key Performance Indicators (KPIs) across any scope of data
- Quickly find important data from multiple locations and systems
- Connect remote offices and mobile employees with SAP data
- Receive updates and make changes to SAP data in real-time
- Quickly generate reports with aggregate information from remote sources

SAP Customer Success

"We chose WebDB Server to integrate data across multiple applications including SAP."
- **U.S. Green Building Council**

Access and Update SAP Data Remotely

xFusion WebDB Server expands options for SAP data access and upload via web services, remote PCs and mobile devices.

SAP customers require remote integration control; not just to SAP, but across other systems as well. With WebDB Server companies can synchronize SAP data within departmental and external applications.

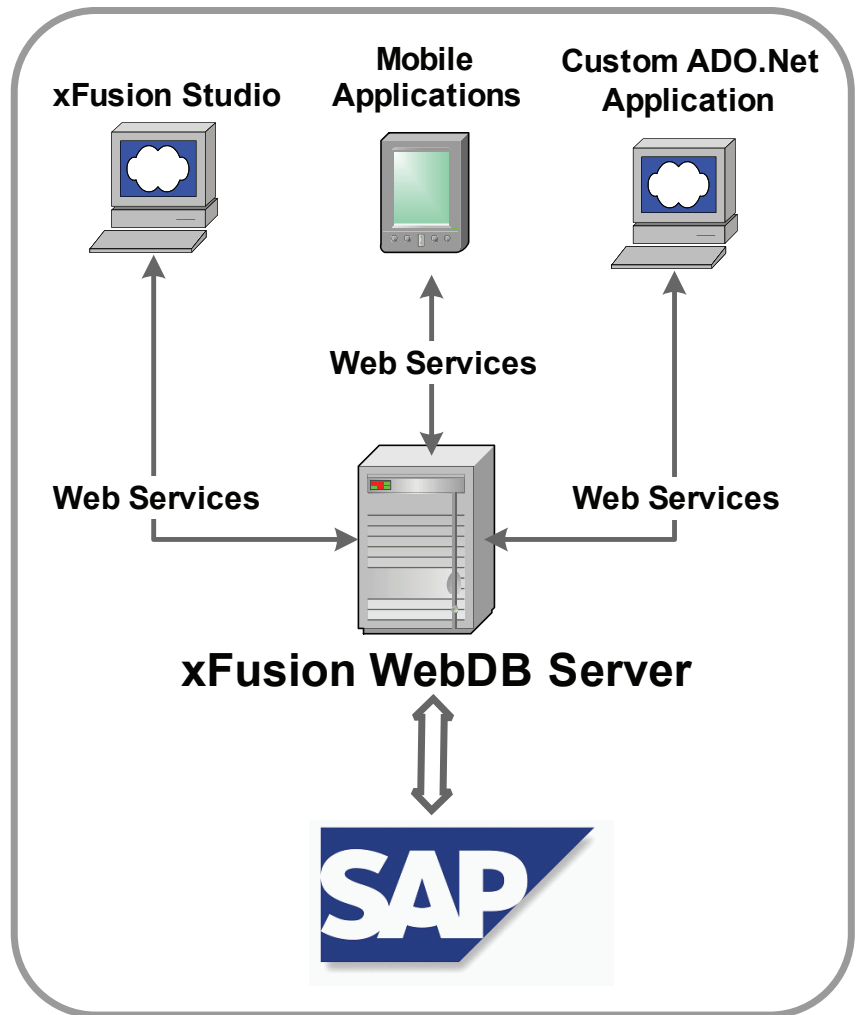

SAP users can also automate the extraction and loading routines and reduce manual coding. In support of team collaboration projects can be shared and templates redeployed to improve development productivity.

Secure data exchange via Web Services enables companies to move data across business units, among partners, and between geographic locations outside the network.

Data integration processes can be built more easily with xFusion WebDB Server. Data access and upload via Excel is one way to quickly exchange data with SAP. ABAP programming is also simplified, and xFusion WebDB Server helps integrate non-SAP data with SAP.

SAP customers need better ways to manage and access their data remotely. Our goal is to provide the best solution for this task, and be your resource for building an better SAP experience.
